March 18, 2019 - Cover Story: Chris Fusco '94 leads the Chicago Sun-Times, delivering news and content in an ever-changing media landscape. '94 is not just a name, it's a time of year - and this year I decided to remember what it means to be a journalist in Chicago, and a year later I got the opportunity to talk with Chris Fusco. We met at the Chicago Sun-Times, where he runs the news department, and Chris immediately talked about how he got into the paper. Fusco, who was born in Chicago in 1968, began his career as a high school teacher, where he taught English as well as community service.

Field of the Invention The present invention relates to a photo-alignment film, a method of forming a photo-alignment film, and a liquid crystal display device. 2. Description of the Related Art In recent years, liquid crystal display devices have been replacing cathode ray tube displays as information processing devices. According to a typical method for producing a liquid crystal display device, a thin glass substrate is used as a substrate for a liquid crystal display device, and it is converted to a glass substrate by cutting a liquid crystal display device substrate from the obtained glass substrate. The glass substrate used for the liquid crystal display device substrate includes a glass substrate on which an alignment film is formed. In general, an alignment film is a polyimide-based resin-containing film including an inorganic resin as a base and a polyimide-based resin as an organic film. Meanwhile, research has been conducted on the use of a nematic liquid crystal having a negative dielectric anisotropy (a negative dielectric constant) as a liquid crystal material. In the liquid crystal display device, however, even when a full color display is performed, a signal voltage of a weak level may be applied to each pixel, depending on a viewing angle. As a result, an alignment of liquid crystal molecules in liquid crystal molecules in liquid crystal molecules in a distorted alignment state is caused. Consequently, the transmittance of the liquid crystal display device may decrease. Here, if the alignment of liquid crystal molecules in liquid crystal molecules in liquid crystal molecules in a distorted alignment state is caused by applying a signal voltage to a pixel when performing a color display (a multi-pixel display), a phenomenon such that a dark image is

displayed as a whole occurs in the whole display region (see Patent Document 1). Thus, the technique is desired which can prevent a decrease in the transmittance of a liquid crystal display device caused by the occurrence of such a phenomenon. Patent Document 1: Japanese Published Patent Application No. H4-340241 Pulmonary hypoplasia associated with polyhydramnios and hypertrophic lung disease. c6a93da74d
