## Ms Office 2007 7z Self Extract S [BETTER]

the --file-offset switch (used earlier) tells the tool where to start the extraction at (i.e., offset) from the beginning of the file (36 bytes from the beginning of the file). the --stream-offset is used to tell the tool where to stop the extraction at (i.e., offset) from the end of the file (68 bytes from the end of the file). the output for this command is shown below: note that the "image" section is the only section that displays the embedded image - you can use a hex editor to see the exact location of the image in the file. however, because we wanted to extract the image, we now need to remove the section that describes the image. at first i thought this was simply a bunch of files with a.cab extension. unfortunately, the "cab" keyword is simply used to signify something that is a compressed archive - see cab file or 7-zip for what a "cab file" is. however, i now know that you can extract a single file in a cab file - a.zip file - using the "extract" tool in the 7-zip archive tool. see cab file or 7-zip for how to extract a single file from a cab file. unfortunately, you cant simply do an admin install on a newly formatted computer and have all of the components come with the.msi installer. but you can run the setup.exe that comes with the office 2007 runtime (the one in c:\program files\microsoft office\office14\ ) and all of the components will be installed. you can do this by running the setup.exe file that comes with the office 2007 runtime and when the setup is done, double-click the office 2007 icon in the system tray and then select run as administrator.
