Beyond enhancement of existing functions, the latest version of Adobe Photoshop introduces some new features. The most distinctive one is the UI, which adopts a finer-grained slider-based navigation, something that I like so much that I can't imagine going back to the previous way." Version 8.0 of Photoshop was released on December 10th, 2009, and I would admit that it was a masterfully-done version. Even at the time, the new features added in Photoshop CS4 were wise, designed to save the user the trouble of fiddling around with opening, formatting, resizing and exporting images. The only change in Adobe Photoshop CS4 was memory management if you used High Performance Mode, which I happened to do. In version CS 5, Adobe introduced the New Features panel, which serves the purpose of providing an overview of commonly-used features, without taking away all the space from a user's workspace. The New Features panel also provides a color-coded view of information, so users can easily view it without having to scroll through the help sections. The only drawback about the new panel is that the Lightroom and Photoshop tabs were added with the icons at the bottom instead of hovering above the main taskbar. In the previous version, the image editor has new features, including gradual adjustments, flattened adjustment layers, text and vector masking, camera raw support, undo/redo and the introduction of Quick Mask. The advantage about the gradual adjustment tool is that you can visually see which areas need editing and which ones don't. It's a huge time saver particularly in areas like composition, where you want to blend all the colors into a new tone right away. However, this option is hidden under the new user-friendly Control Bar, where everything is now easily accessible and visible.
