Your passing look, your cold smile Sometimes, they make me run out of breath We keep missing each other You and I, our time You're...LAS VEGAS -- One month after the NBA season ended, the San Antonio Spurs have ruled out center Tim Duncan for the rest of the 2013-14 season, citing a left thigh issue. The three-time NBA champion was limited to 31 games in the lockout-shortened season, scoring 7.6 points on 5.3 rebounds and 2.2 blocks in 23.2 minutes per game. Duncan missed seven games between March 4 and April 8 with the injury, and also sat out the playoffs following a left hamstring strain. "We've been planning this ever since I got injured," Duncan said before the Spurs' season finale against New Orleans. "We're getting closer to getting it right." Forward Kawhi Leonard will be a full-time starter and Tiago Splitter will take over Duncan's starting center spot with the playoffs on the horizon. San Antonio will need a replacement for Duncan in the offseason while offering little in salary cap relief. Duncan expressed sympathy for Duncan's balky left leg. "It's hard to push through. You hate to see it," said Duncan, 36. "But it's obviously something that needed to get done. You have no choice but to make sure that you're able to move the leg as well as possible." Manu Ginobili's future with the team is uncertain because of a torn Achilles tendon. The Spurs have 21 players under contract for next season. "I can't really say anything," coach Gregg Popovich said when asked about Ginobili, who did not speak with the media after Game 6. "He's been a lot better the last couple weeks. He doesn't look like he's hurt at all. So that's what we're hoping for." Ginobili had a breakout performance in the playoffs. He averaged 18.3 points on 50.4 percent shooting, a career

Download mp3 Bts Dance Practice Mp4 bts run dance practice mp3To the Editor, Contrast-induced nephropathy (CIN) is the third most common cause of hospital-acquired renal failure after acute ischemic stroke and hypovolemia ([@ref1], [@ref2]). Comorbid medical conditions such as diabetes mellitus, hypertension, heart failure, peripheral vascular disease, a history of contrast exposure and congestive heart failure are risk factors for CIN ([@ref3]-[@ref5]). Cardiac stress can be defined as increased risk of adverse cardiovascular or cerebrovascular events when myocardial ischemia is associated with the primary procedure or contrast agent ([@ref6]). CIN occurs either as a primary or indirect complication of cardiac stress. The most common mechanism of renal damage is tubular ischemia. Direct toxicity may be evident in the form of impairment of renal function. Other contributory factors are decreased renal blood flow, activation of the renin-angiotensin system and release of arachidonic acid metabolites, which in turn activate kinin and 5-lipoxygenase pathways ([@ref6]). Reports have shown that some noninvasive electrocardiographic markers, such as QT dispersion (QTD), QTc dispersion (QTcd), T wave peak-to-end interval dispersion (Tp-e), standard deviation of ST-segment duration (STD-SDS), and Tp-e/QT ratio (Tp-e/QT) can be used to identify risk of myocardial ischemia or cardiac ischemia. In patients with acute myocardial infarction, QT dispersion (QTd) and Tp-e (Tpe) can predict future cardiovascular events ([@ref7]). Noninvasive electrocardiographic markers can also be useful in the detection of myocardial ischemia in patients with chronic heart failure. Ricci-Cherto et al. demonstrated that noninvasive QTcd is a highly sensitive marker of myocardial ischemia in patients with chronic congestive heart failure. They also showed that an increased QTcd and QTcd/QT ratio during exercise can be helpful in the detection of myocardial ischemia in these patients ([@ref8]). Our aim was to determine whether Tpe and f988f36e3a
