MorseWriter enables users to enter words or numbers into the keyboard and send them to a connected printer using Morse code. MorseWriter combines the speed of a text editor with the effectiveness of a typewriter. MorseWriter will convert the text you enter into a dot-dash-pause sequence that can be sent over a telegraph line or telephone wire. MorseWriter Key Features: *Converts Morse code into dot-dash-pause sequences that can be sent over a telegraph wire or telephone line *Works with any input language, including Portuguese, French, Spanish, German, and many others *Spell check, Word count, and even letter count functions *Allows for importation of text files *Provides an easy to use text editor that works in conjunction with the converter *Great for beginners and advanced users *Supports UTF-8, ANSI, and ASCII encoding formats *Supports numbers as well as letters, alphabets, and symbols A: I created one (based on the older MorseWriter), called MorseDotDash which I find much easier to use: I put it on GitHub if you want to give it a try. I use it with a Zebra printer, and I mostly send messages from my Macs to my printer (by way of sending with LibreOffice). I wrote a “.dot” format that I use, that can be read using cut and paste into a new line of an HTML document. It uses the same Teleg file format (by Dan Connolly) as MorseWriter, and my translation doesn't differ greatly from the original. Costs of colon cancer: variations in stage and treatment. We studied economic factors associated with colorectal cancer stage and treatment in the context of cancer control activities. We compared Medicare costs for the treatment of 582 patients diagnosed with colorectal cancer in 1987 to Medicare costs for 661 persons who were cancer-free in 1988, using health services use data obtained from a survey conducted in 1996-1997 in a representative sample of Boston, MA residents. The average cost per patient with cancer was \$34,453, and the average cost for patients free of cancer was \$30,356. Patients who were diagnosed as stage IV were on average 27% more costly than were those with stage I. Patients with stage III cancer were only 9% more costly than patients with stage I. The cost of cancer treatment increased with stage

MorseWriter is a basic Morse code editor for Windows, which provides a basic introduction to Morse code and shows how it can be used to send messages over long distances. Frequently Asked Questions: Q: What's Morse code? A: Morse code is a way of sending messages over long distances using a technique called telegraphy, which works by using short pulses of electric current. Each character of Morse code consists of a sequence of dits and dahs, and pauses to indicate the end of a message. This allows for efficient long-distance communication by breaking the messages up into smaller chunks and repeating them. Q: Why do I need Morse code? A: There are numerous uses for Morse code, but it is mainly used to transmit messages over short distances. You could use Morse code to encode a phone number or chat, for example. Q: Where can I find Morse code? A: Many countries use Morse code for ship-to-shore communications. As a result, you can find Morse code fonts and keypads to copy and translate Morse code characters.
