Photoshop has always been able to browse the web to get stuff done. They made Lightroom do this since before Lightroom existed. This latest improvement allows you to pull up books, lessons and other parts of the web in one place to quickly grab images or reference for a particular task. Photoshop encourages you to zoom and crop as much or as little as you want, and if you are editing on a shared drive (or external drive) you can select a different drive to save to if you want. The program's performance is also a tick up, so you can see when it's a bit sluggish. With a professional library of millions of images and a robust suite of features and tools, you can do almost anything with a digital image. Use the power of Photoshop to create stunning images, prepare images for printing, add and manipulate special effects, prepare for the web, and publish your pictures as high-quality digital files. Personally, Photoshop is really good to make changes to images. I always learn a lot, with new features, retouching, and so on. I often use the Quantification function to find out how much I can do and what areas I can improve. Overall, the interface is really well organized. Give me a software solution where I can work on images that I want to work on, nothing more. Photoshop gets in the way of that. IMHO when you want to mark up an image you should just not use a photo editing program. I thought it was a great feature to have...at least until I found out it wasn't. In time, something will come along that can take over the creation of an image without all the hefty operations and menus but until that day Photoshop just gets in the way and ruins your work. It's not unlike saying that you want to design your own house without the tools. Thank god for DxO. I can use it without annoying windows popping up and my computer can't get bogged down with hundreds of files in the background. Thanks! Kate
