Cracking Adobe Photoshop is not as straightforward as installing it. It requires a few steps to bypass the security measures that are in place. First, you must obtain a cracked version of the software from a trusted source. After you have downloaded the cracked version, you must disable all security measures, such as antivirus and firewall protection. After this, you must open the crack file and follow the instructions on how to patch the software. Once the patching process is complete, the software is cracked and ready to use.

The new Live Gradient tool lets you create live gradients. These are essentially quick and easy image corrections that take advantage of the tools and technology in Photoshop and mimic the real-life effect of physically applying paints or stains. The Gradients panel has been cleaned up and made more intuitive, but more on that in a moment. You can use this tool to quickly paint a gradient over any given spot in a photograph, whether it be a color, highlight, lighting, or even a specific effect, and also create subtle variations. For example, if you have a gradation that's more yellow than orange, you can wrap it around a hotspot of orange, and by using the Gradient Tool creates a subtle shading that makes the image feel warmer. If feature layers are turned off, it will create a normal gradient—such as from a solid color to black or white, or from a 50/50 mix to pure white. Additionally, the new Feature Flow tool lets you finish a feature layer inside of an object instead of using the layer as a whole. The tool, which is a bit like an insert-collapse-insert feature, lets you cross out any areas that you don't want an object with the same photo as the picture below is an example. You can choose between a simple object selection and a rough selection if you want to, and you can select different areas with different featuers. When making adjustments to the area, you'll be able to fade the changes so you can easily continue tweaking the remaining area. If, however, you're using masks, creating the feature is a bit different. You can select an object with the selection tool, adjust that object's properties, and then use the magic wand to select areas inside it.

This post shows Photoshop's default settings when new layers are created. In addition to a default layout, you can change the name of the layers and the selection can be outlined or filled. Note that these settings are saved, so the default settings for new layers are also used whenever a layer is created. However, you can edit the initial settings in a new layer by going to the *Custom* menu and clicking *Edit Settings.* You can refine the new layer settings as you wish. In this example we will only use the **"Remove Background" checkbox.** All changes to the new layer settings are saved. Existing layers do not retain their defaults, so if you change the settings you need to **re-select the default settings before creating a new layer**. Another amazing filter is the Travel Blur.
