Substance Player is a comprehensive software tool that features advanced tools to help you create texture variations and export them to image files. Pro-grade interface and sample designs The installer is lengthy but includes only familiar options. Once it finishes, you are greeted by a fullscreen window with a dark theme and professional-looking structure, where you can get started by selecting the rendering engine. A sample design is loaded by the app by default, and you can view it in 3D. Substance Player has a few other samples too, in addition to letting you import textures from various file types, including bitmaps without Substance metadata files. Modify 3D object settings and set up 2D texture parameters It's possible to modify the object's geometry and load AutoDesk, 3DS, AutoCAD and Collada meshes, rebuild the materials, edit the scene when it comes to the lights and environment, view the image from a different perspective, hide the grid, show an axis and light, or enable a bounding box. As far as the texture is concerned, you can adjust the output size, random seed, dirt, fibers, knots, splinters, depth, relief balance, emboss, angle, hue shift, saturation, luminosity and contrast, as well as view the texture in diffuse, specular, normal, bump, displacement or height mode. Once all settings are made, you can save the project as a bitmap image (e.g. BMP, DDS, ICO, JPG, JIF format), enable or disable Substance metadata, embed tweak values and the SBSAR file, as well as include or exclude the diffuse, specular, normal, bump, displacement or height outputs in the export. Evaluation and conclusion No error dialogs popped up in our tests, and the utility didn't hang or crash. It used low CPU and high RAM, and carried out commands rapidly. Taking into account its rich yet comprehensible options, Substance Player should meet the requirements of many users looking for a reliable app for creating 2D textures from 3D objects. Plus, it's free. Description: 3Dmigoto is a 3D rendering software which is able to generate 3D models from 2D photos, or in other words from photos with 2D objects.
