JAZLER TV Star One 1.1.60 Jazler TVStar One VS:VS. 01.01.60 - update.rar Indonesian sentra ga pernahma jezik bahasa singapore Pas kandungan yang dapat ditampilkan ini bisa.A giant aneurysm of the right proximal internal carotid artery presenting with complete carotid artery occlusion. In patients with diffuse atherosclerotic carotid arterial occlusive disease, however, a patient who can be stably kept alive without medical intervention is rarely seen. In such a case, aneurysmal dilatation of the proximal ICA is considered the main cause. We describe a patient with an aneurysm of the right proximal ICA with complete occlusion of the right carotid artery. The patient underwent successful endovascular treatment via a trans-femoral approach with a stent. After 14 months of follow-up, the aneurysm had been removed completely. The presented case suggests that a giant aneurysm of the right proximal ICA can present with complete carotid artery occlusion, and that in such cases, endovascular treatment can be effective.Q: Matching quotes in R data.frame I have a column of string with a lot of data in R. Example data: "value1","value2","value3",... I would like to create a new column in a data.frame that matches the quotes with the quotes that it finds (a unique identifier for each row), thus the result should look like this: "value1","value2","value3" Is there a way of doing this with grep and gsub? I am looking for a general solution, not something that only works in specific cases. A: Use stringr::str_split and str_remove_all library(stringr) str_split(df\$data, ",") %>% str_remove_all(""," ", fixed = TRUE) %>% str_replace_all(""," ", "") %>% str_trim() Or the paste function with collapse paste(gsub(""," ", df\$data), collapse = "") f988f36e3a
