Lightroom's file browser has also improved (iTunes compatibility was added in version 4, which I'll cover separately). Not only have the advanced functions been upgraded (i.e., the thrust of "updating your software"), but the images and their various types can be moved to other folders with a simple drag and drop gesture. It works just like you'd expect it to. Anything that enables you to save and improve your workflow (i.e., batch processing of sorted images, Load and Save presets, to name a few) is good for photographers. In order to make a tool useful for pushing the automation, it needs to employ repeatable actions. For example, you can convert all images of a certain type (e.g., the ones you shot with your Blackmagic Pocket Cinema Camera) to DNG and put them in a folder named "Cameras and Cameras Only" if you want to go back later and process them in Lightroom. I often suggest this workflow to photographers I meet at trade shows and other events. Lightroom finally has a save as function for images that you're processing using Camera Raw. The only thing that's missing is a choose file type form. But, if you save your raw files as DNG, you can convert each individual RAW image to any file format (including PSD or TIFF) without any need to apply image-file-format conversion presets that you may have acquired over the years. Adobe is in the position to be able to push this much cloud-based stuff, because it makes a ton of money selling the cloud subscription and it can collect more sales data for its products via the cloud.

If you are using Photoshop's "3D Camera Raw," you may have noticed the developer added a collection of enhancements to the Camera Raw previews. Among them is a revamped selection tool and adjustments to Lens Correction tool settings. One of the main uses of Photoshop is to edit photographs. So, for example, if an image is displayed in a browser, the browser may crop off an image to a particular size for display. Therefore, you can use the photo editing tools to crop the image if you want it to be displayed to its native size. In the case of screens where you can't see the image in its entirety, you may want to crop it to a particular aspect ratio. To do so, use the Crop tool. Create a selection with the Crop tool, and choose the crop ratio you want by selecting a factor from the toolbar at the bottom of the crop window. For example, at 200 percent, the resulting crop will display the image twice as large as its original size. When using the Crop tool, a border appears around the area of the image you're selecting. A border may be useful in some situations, such as when you're creating background textures for a photo or drawing. So, you may want to turn off the border to eliminate unwanted borders when you create a background for a photograph or drawing. With the Crop tool, you can also select a particular area or area using a selection marquee and then crop the marquee as a selection. For photos, you may want to create new adjustments that have no effect on the photo's layers. For example, you might create a custom colors adjustment layer to apply a new color to an image, without affecting any layers that are on top of the image.
