The new release of macOS Sierra is generally Mac, but some features such as gestures are very iPhone-like and lead to some problems. One problem seems to be with files in the cloud. I tried to share a number of images (e.g., *Africa.jpg*) with a friend on the Mac, but they ended up distorted. I was able to use the same image with the exact same settings on a new iPad, iPhone, and on a computer running Windows 10. The new Adobe Photoshop Touch for iOS and Android is a free version. It may have some bugs, but it has some great features. Photographers can share their work through social platforms and get feedback from friends. The editing tools on the phone have been designed to be easier than those of Adobe Photoshop on the desktop. You'll be able to share images via Facebook, Twitter, and Google+. Highlights, Fentons-style, come easily when you create customizations via the UI. Irregardless of whether the element is moving or fixed-size, you can highlight it in a curved path to change its appearance. You can change the color of the corner, the drop shadow, the fill, the stroke, and even remove the outline. It's pretty intuitive in that regard, but there are some notable downsides. The Pencil does a great job of recording strokes, but it isn't as good as a mouse in terms of precision. Using the Pencil is great for a quick retouch as you can fill in areas that aren't perfect, and the closer you are to the actual area being edited, the more accurate the results are. However, the pen doesn't fill in areas of the image, it strokes out the path, like you'd do with the eraser. It's nice for quick retouching, but I'm looking forward to seeing how the AI can operate when we get closer to working in larger images.
